AutoCAD is considered a powerful drafting and architectural tool for architects, engineers, and drafters. Preface Autodesk AutoCAD was developed in 1982 by John Walker and released to the public for the first time in December 1982. This section of the website describes the product's origins and development and provides a history of its past and present. The following sections address how to get started with AutoCAD, and how to use the software program. A look back in AutoCAD's history AutoCAD was originally developed for the Apple II personal computer. It was developed to draw and draft engineering designs that were more complex than the commercially available drafting software of the day (and, in fact, today). Its earliest iterations are still in use and have been updated to keep up with architectural and engineering practices. The original AutoCAD for Apple II had a type font that was also used on the Apple IIGS in 1989. Development of the first version of AutoCAD was led by John Walker, an engineer at the time, and his team of drafters. There were only two drafters and one programmer. A later version of AutoCAD, also for Apple II, was a continuation of the original release with support for three drafters, more programmers, and additional features. This version, also known as AutoCAD 1.1, was released in February 1983 and is considered the first release. When a group of drafters, programmers, and marketers from Autodesk gathered in July 1982, they were looking for a piece of software that would allow them to design and draft architectural and engineering drawings in a professional manner. They realized that if the first release was similar to what was commercially available in the industry, their proposed software would be eclipsed and lost to the competition. The group met at a McDonald's restaurant and decided that the system must have a high level of ease of use, good communication between the people who used the software and the people who wrote it, and most importantly, the ability to work quickly. They created the product that became AutoCAD. AutoCAD 1.0 for Apple II A team of four drafters and programmers were responsible for creating the first release of AutoCAD. The team was originally working on a proposal for the drafters at General Electric (GE) and needed to create a design and drafting software that was easy to learn and had the flexibility to support complex architectural and engineering designs.

Geometric Modeling The Dynamic Modeling environment in Autodesk Inventor allows a user to manipulate 2D and 3D geometric models. With the introduction of version 2012, Autodesk Inventor was renamed to Autodesk Inventor Autodesk and the environment was redesigned. The old Dynamic Modeling environment was split into two parts: Autodesk's familiar Dynamic Modeling environment for non-technical users. The Autodesk Inventor Autodesk environment for technical users. Both environments are based on the 2D and 3D sketchup environments. 2D and 3D sketchup functionality are combined together to achieve the goals of both 2D and 3D sketchup, however in this release Autodesk Inventor Autodesk differs significantly from Autodesk Sketchup. Topological Modeling Autodesk Inventor has a topological modeling environment which includes topo modeling, editing, and exporting. Topology is a way of describing the topology of a geometry. IFC Import Autodesk Inventor supports the ISO 19115:2003 standard for Open Structured Business Information – Exchange format (IFC) and has a companion import tool called IFC. The module can import the standard IFC, which is in the form of an open XML file. IFC is a standard schema for the data exchange of all types of businesses. CAD Import Autodesk Inventor supports CAD import. Input Tools Autodesk Inventor provides an extensive array of input tools for manipulating models. CAD and Drafting Autodesk Inventor supports 2D and 3D CAD and drafting. Other capabilities include: Object, data, and scale management. Part selection and grouping. A full functional CAD environment. Geometry management. Database capabilities. Ability to create, edit and share views. This article takes a close look at some of the statements parents have been called in the past and how you can defend yourself in this highly charged debate. Many vaccine advocates argue that parents are being selfish for not having their children vaccinated. The title of this blog entry makes it clear that I, and many of the authors of this blog, disagree. Let us look at some of the common claims parents have been called to defend their decision to immunise their children. 'You are Losing the War Against Vaccination' The claim 'you are losing the war' against vaccination, is such a common argument that it has a name in psychology – the magical thinking defence. It is a psychological defence which involves a belief in a magical process that guarantees success. This means that parents cannot be held responsible for any negative outcome of vaccination; it is not their fault. Since the global measles outbreak started in 2015, many have claimed the war is being lost. According to Richard Besser, president of the Centers for Disease Control and Prevention (CDC), this is not true and there is still much to do to eliminate measles and other vaccine-preventable diseases. The CDC released a statement in July of 2017 in response to the rise of measles, stating: 'CDC works closely with state and local health departments and our partners across the public health community to detect and quickly contain the spread of measles.' 'We Don't Need Vaccinations' This claim is an outgrowth of the magical thinking defence – 'vaccination is unnecessary and we don't need them.' According to this thinking, all children are already vaccinated. Therefore, there is no need to immunise children with a variety of diseases, including influenza and pneumococcal disease. Many of the people making these statements are now parents themselves, which means they also have a child and are therefore very familiar with these diseases. It is important to note that the MMR vaccine is the only vaccine that is recommended to all children. However

Markup Import and Markup Assist Markup Import allows you to import text, images, and symbols directly into a drawing as markup. You can also import external markup files with drawings and associated text, images, and symbols. Importing external markup is faster than importing from an external source such as a Microsoft Word document. (To learn more about using Microsoft Word for import into AutoCAD drawings, see Microsoft Word: How to Import into AutoCAD.) Import text as markup Import any image as markup Import symbols as markup Import external markup files Markup Assist helps you import external markup faster and more efficiently. AutoCAD Import Assist automatically guides you through the import process, gives you an estimate of the
