Dune 2000 (short for Dune II: The Artifact of Doom!) is a 1997 third-person action-adventure video game developed by Westwood Studios and published by Electronic Arts for Microsoft Windows. It was followed by a 1997 sequel, Dune II: The Building of a Dynasty. The third game in the Dune series, it was the first to feature a 3D game engine, rather than the tile-based graphics of the first two games. Dune 2000 was originally released in the United States on June 18, 1997, for Microsoft Windows, and later in Europe and PAL regions in the same year. It was then re-released in the UK and Australia in 1998 as Beneath the Spheres. The game is a sequel to the 1990 PC title Dune. It tells the story of Herbert of Dune, Duke Leto, and Paul in the waning days of the Tleilaxu Imperium prior to the succession of Paul Atreides. The game was loosely based on a 1980s Dune novel by Frank Herbert. The game follows the story of Paul Atreides and the Fremen in the original Dune novel, while maintaining some similarities to the preceding Dune II game. Dune 2000 is widely viewed as one of the worst video games of all time. game's three main characters would be joined later by the genetically engineered Kwisatz Haderach (Fedaykin), the ghola of Leto Atreides, and the creator of the Atreides Armada, the pre-Paul's Time emissary. The player could explore cities and regions of the fictional planet Arrakis. The game was released on Microsoft Windows only for the PC and was considered a commercial failure. The game provides players with extensive exploration and combat, similar to the original Dune. An online campaign and skirmish mode are offered as well. However, the console version of the game did not include many of the games content, besides leaderboards for online multiplayer mode. The game's plot was also severely shortened for the console version.

hydrocarbons is depleted, the need for an internal combustion engine
with increased efficiency and reduced fuel consumption is of critical
importance. There is an ongoing development of automotive engines
that use a combination of fuels, such as gasoline and alcohol. The
increased use of ethanol in automotive fuel has provided a means to
reduce the amount of gasoline that is used in an engine. The use of
alternative fuels have enabled the engines to burn a greater fraction of
a fuel mixture. In addition, the use of alternative fuels has enabled

engine designers to improve performance. For example, the use of alcohol in an engine enables a higher compression ratio. Because there is a greater mass of the combined fuels (i.e., the gasoline and the alcohol), the engine is able to operate at
