This article is geared toward beginners and simple tasks. However, we do want to give a nod to those with intermediate skills as well. More advanced features are covered in the article, too. Use Photoshop for Easy Fixes Start with a small project and practice using the tools as well as features like Smart Objects. Stay away from complex designs as the learning curve can be steep for beginners. Design for Uneven Sheets When printing, you should always have a good-sized printable area on each side of the template. For uneven sheets, this area should be fixed on the top and bottom, so that the pages and all the text are the same size. This area is what you will print on first. Get to know how to trim a sheet

of paper accurately. Trim Sheets with the Paper Tray As you prepare print files, you may want to add guides to keep pages straight and match the template. Traditionally, a page is trimmed with a ruler and scissors but you can also use a paper tray on your printer that holds a number of sheets at a time. There's no need to waste paper by trimming each sheet individually, when you can trim all the pages at the same time. Download Photoshop's Trim Sheet Paper Tray and place it on your printer. Trim the Sheets at the Top and Bottom After you've printed your first three or four pages and are used to how you're trimming the sheets, you can't help but notice that the bottom sheet seems to be longer than the top sheet. Note the discrepancy here. When you're trimming the sheets individually, you may find it difficult to

determine where to cut a page, because all the pages are slightly different. And if you accidentally cut into the page, you have to completely redo it. Get yourself a paper tray and a flat piece of printer paper, and carefully place the tray onto the surface of your printer. Then place all the pages to be trimmed onto the tray and align them carefully. Now, you can simply trim away the excess paper. This is a quick, easy way to trim all the pages at once.

1. Select Trim to Paper Tray from the Photoshop Menu. Select Trim to Paper Tray from the Photoshop Menu.
2. Now you can trim away any remaining paper on each sheet. The Paper Tray makes things even easier.

1. Field of the Invention The present invention relates to a semiconductor device having a so-called trench gate structure, and more particularly, to a semiconductor device having a source electrode and a trench gate structure.

2. Description of the Related Art In recent years, DRAMs with a trench gate structure have been proposed (e.g., see Japanese Unexamined Patent Application Publication No. 2004-75992). In these DRAMs, a conductive material is buried inside a trench. Furthermore, the conductive material is used as a gate electrode that is buried in the trench. FIG. 9 is a plan view of a section in the X-Y direction in a DRAM having a conventional trench gate structure. In

FIG. 9, a DRAM 50 has a trench structure. In the DRAM 50, a trench 52 is formed. A gate oxide film 54 is formed on the inner surface of the trench 52. A buried gate oxide film 56 is formed on the inner surface of the trench 52. A polysilicon film 58 is formed on the surface of the buried gate oxide film 56. The polysilicon film 58 serves as a gate electrode buried in the trench 52. An oxide film 60 is formed on the surface of the polysilicon film 58. An interlayer insulation film 62 is formed on the entire surface of the DRAM 50.

Source electrodes 64, gate electrodes 66, and gate interconnection layers 68 are formed on the interlayer insulation film 62. Here, the polysilicon film 58 serves as a gate electrode that is buried in the trench 52, and the oxide film 60 formed on the surface of the polysilicon film 58 serves as an insulation

film that covers the gate electrode. An insulating material is used as a material for the trench 52. The insulating material fills up the upper portion of the trench 52 up to the lower end of the gate electrode. The source electrode 64 is placed below the lower end of the gate electrode 66. The source electrode 64 contacts the polysilicon film 58 on the bottom of the trench 52. Accordingly, the source electrode 64 contacts the lower end of the gate electrode 66.

Q: How do I access the "loop" parameter of a function to use it in a function that calls it? I know that I can get all the parameters using `kernel.get_default_context().get_params()` but I don't know how to use the "loop" parameter.
