Extensibility AutoCAD offers a number of solutions for extensibility, including third party scripting language packages, custom plug-ins, data exchange formats, XML databases and data-interchange products such as CED, NET, ADODB, ADO.NET, ADO, BDE, ODBC, and XML. The DXF format, developed by Autodesk, is used for exchanging drawing information. CAD software vendors have been making AutoCAD and DXF exchange as a standard. Other software is also able to read and edit AutoCAD drawings. Autodesk Exchange Apps is a subset of AutoCAD Exchange on the application store. CAD vendors can enable their software to read and edit DXF files and produce DXF files using tools provided by Autodesk Exchange Apps. History AutoCAD started development as DrawaRX in 1986. It was created by a team of five engineers in the Autodesk Translation Center and was originally developed for the Apple Macintosh, but was ported to Windows in 1988. In 1989, the team moved the software into the Autodesk Translation Center. In 1994, the project was officially spun out as AutoCAD, when the company was formed. With version 3.0, released in 1991, the product was renamed to AutoCAD to meet Microsoft's guidelines for product names. The first Windows-based AutoCAD, AutoCAD LT, was introduced on June 17, 1995. In 1997, AutoCAD NT was introduced. It was later renamed to AutoCAD 2000, which was the last version to be based on the Windows NT kernel. The product introduced the Ribbon. The architecture of the software was later changed to be available only for Microsoft Windows, and no longer Mac OS or Linux. After the release of the new Windows XP operating system in 2001, the developers decided to keep the software for Windows as it was. The current version is AutoCAD R2013. The transition from the UI into the Ribbon enabled designers to carry out multiple drawing and editing tasks in the software without any trouble. AutoCAD's functionality was at that time expanded to include many tools that were previously absent in previous versions. Autodesk also introduced its Connection Manager, which is able to work with any data format in any program. It works like a translator between two programs that do not use a common data format. These two programs could exchange data through the Connection Manager. Later in the product's development ca3bf1094

Here is the method I wrote : protected static function getModelByID(\$id) { \$model = DB::table('models') ->where('id',\$id) ->first(); return \$model; } This work just fine. Now I want to make a factory function so that I can easily reuse the function by typing : Factory::getModelByID(2); And the function should return a model. I tried something like this : protected static function getModelByID(\$id) { \$model = Factory::make('App\Models\Model') ->where('id',\$id) ->first(); return \$model; } But it returned null. Here is my model class : use App
