
KMSOffline 2.0.9 Full Version [update 5 20 2019] ((LINK))

The vSAN accelerator engine is fully compatible with VMware FT. vSAN is implemented on a PowerVM hypervisor, so our customers can take advantage of the new capabilities in PowerVM if they choose to do so. The initial release of vSAN 8 ESA appears to have achieved great success for our customers. While the great majority of our customers are happy with 8.5, there are a number of customers who have been looking forward to our multi-AZ capabilities for the last few months. For those customers, the introduction of the 8.5 release to fully support this capability is right on schedule, and in most cases, planned for a similar release cycle to vSAN 7.5. Our customers have been using vSAN for years, and many of them have been waiting to upgrade to 8.5. vSAN 8.5 release does not disappoint, and many customers are already deploying to 8.5. Most of the workloads can benefit from 8.5's capabilities. For those workloads, it's important that vSAN can keep up with the addition of new features. vSAN 8.5 is a supported upgrade, so there will be a number of incremental releases and service packs to follow the initial release. Our customers will continue to have updates that support new features that vSAN provides to their workloads. With the release of vSAN 7 U3, we introduced core-wide snapshots and the use of file share snapshots as a backup source. The first full version of the vSAN ESA introduces a new feature we call PX clone - PX Clones. A PX Clone is a technology to copy snapshots that are currently published in a backup repository such as a backup tool.
