Astronomy Software Computer software to find. More than 2500 astrologers have contributed to the authors in astrology and.Q: How to get the required matched value from a data frame? I am trying to match the occurrence of a set of words from the first column of the data frame to another column in the same data frame. The output should be a list of matched words which are the same across the two columns. I tried to use grepl function from the plyr package and can retrieve the matched text in the data frame using myText[grepl(row1,col2)] which is the code for one row of the data frame. However, in my real data frame there are 100's of rows. I want to apply this across all rows. But plyr doesn't allow me to use the apply function to apply this. Here is my code: library(plyr) myText=read.csv("Academic Performance Peer Assessment : State Level Peer PRC 79a2804d6b
